# MECHANICAL ENGINEERING <br> STRENGTH OF MATERIALS <br> CBCGS(DEC- 2017) <br> Q.P.Code: 27636 

1.(a) If a round bar of 37.5 mm diameter and 2.4 m length is stretched by $2.5 \mathbf{~ m m}$, find its bulk modulus and lateral contraction. Take Young's modulus $=110 \mathrm{GN} / \mathrm{m}^{2}$ and shear modulus $=42 \mathrm{GN} / \mathrm{m}^{2}$ for the material of the bar.
$\mathrm{D}=37.5 \mathrm{~mm}=37.5 \times 10^{-3} \mathrm{~m}, \mathrm{l}=2.4 \mathrm{~m}, \delta \mathrm{l}=2.5 \mathrm{~mm}=2.5 \times 10^{-3} \mathrm{~m}$
$\mathrm{E}=110 \mathrm{GN} / \mathrm{m}^{2}=110 \times 10^{9} \mathrm{~N} / \mathrm{m}^{2}$
$\mathrm{G}=42 \mathrm{GN} / \mathrm{m}^{2}=42 \times 10^{9} \mathrm{~N} / \mathrm{m}^{2}$
Using relation, $\mathrm{E}=2 \mathrm{G}\left(1+\frac{1}{m}\right)$

$$
\begin{aligned}
& 110 \times 10^{9}=2 \times 42 \times 10^{9}\left(1+\frac{1}{m}\right) \\
& \left(1+\frac{1}{m}\right)=\frac{110 \times 10^{9}}{42 \times 10^{9}} \\
& \therefore \quad \\
& \frac{1}{m}=0.30952
\end{aligned}
$$

Bulk Modulus: $\mathrm{E}=3 \mathrm{~K}\left(1-\frac{2}{m}\right)$

$$
\begin{aligned}
\mathrm{K} & =\frac{E}{3\left(1-\frac{2}{m}\right)} \\
\therefore \mathrm{K} & =\mathbf{0 . 9 6} \times \mathbf{1 0}^{5} \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

Longitudinal Strain: $\mathrm{e}=\frac{\delta 1}{\mathrm{l}}=1.0416 \times 10^{-3}$
Lateral contraction: $\frac{1}{m}=\frac{\text { Lateral strain }}{\text { Longitudnal strain }}$

$$
\therefore 0.3095=\frac{\text { Lateral strain }}{1.0413 \times 10^{-3}}
$$

$\therefore$ Lateral strain $=3.223 \times 10^{-4}$
Now, Lateral strain $=\frac{\text { Lateral contraction }}{\text { original lateral dimension }}$
$\therefore$ lateral contraction $=1.208 \times 10^{-5} \mathrm{~m}$
1.(b)A flitched beam consists of steel and timber as shown in figure. Determine the moment of resistance of the beam. Take $\sigma_{s}=100 \mathrm{~N} / \mathrm{mm}^{2}$ and $\sigma_{w}=5 \mathrm{~N} / \mathrm{mm}^{2}$.

$\sigma_{s}=100 \mathrm{~N} / \mathrm{mm}^{2}, \sigma_{w}=5 \mathrm{~N} / \mathrm{mm}^{2}$
Moment of inertia $I_{\text {wood }}=2\left(\frac{B D^{3}}{12}\right)$

$$
=2\left(\frac{50 \times 200^{3}}{12}\right)=66.67 \times 10^{6} \mathbf{~ m m}^{4}
$$

Moment of inertia $I_{\text {steel }}=2\left(\frac{B D^{3}}{12}\right)$

$$
=2\left(\frac{10 \times 200^{3}}{12}\right)=6.67 \times 10^{6} \mathbf{~ m m}^{4}
$$

Moment of resistance $\mathrm{M}=M_{\text {wood }}+M_{\text {steel }}$

$$
\begin{aligned}
& =\left(\frac{\sigma}{y} x I\right)+\left(\frac{\sigma}{y} x I\right) \\
& =\frac{5 \times 66.67 \times 10^{6}}{100}+\frac{1000 \times 6.67 \times 10^{6}}{100}
\end{aligned}
$$

$$
=70 \mathrm{kN}-\mathrm{m}
$$

1.(c) Draw the S.F and B.M diagrams for the beam loaded shown in the figure.

$\sum M_{A}=0$
$\therefore M_{A}+$ PL-P $(L-a)=0$
$\therefore M_{A}=\mathrm{Pa}$
$\sum F_{y}=0$
$\therefore \mathrm{V}_{\mathrm{A}}-\mathrm{P}-\mathrm{P}=0$
$\therefore \mathrm{V}_{\mathrm{A}}=0$

Shear force calculations:
$\mathrm{SF}_{\mathrm{CR}}=0$
$\mathrm{SF}_{\mathrm{BR}}=\mathrm{P}$
$\mathrm{SF}_{\mathrm{BL}}=0$
$\mathrm{SF}_{\mathrm{A}}=0$
Bending moment calculations:
$\mathrm{BM}_{\mathrm{C}}=0$
$\mathrm{BM}_{\mathrm{B}}=-\mathrm{P} \mathrm{X} \mathrm{a}=-\mathrm{Pa}$
$\mathrm{BM}_{\mathrm{AR}}=-\mathrm{PL}+\mathrm{P}(\mathrm{L}-\mathrm{a})=-\mathrm{Pa}$
$\mathrm{BM}_{\mathrm{AL}}=-\mathrm{Pa}+\mathrm{Pa}=0$

## S.F and B.M. Diagram :

1.(d) Calculate the bursting pressure for a cold drawn seamless steel tubing of $\mathbf{6 0 ~ m m}$ inside diameter and $\mathbf{2 ~ m m}$ wall thickness. Ultimate strength of steel is $380 \mathrm{~N} / \mathrm{mm}^{2}$.
$\mathrm{d}=60 \mathrm{~mm}, \quad \mathrm{t}=2 \mathrm{~mm}$
$\sigma_{h}=380 \mathrm{~N} / \mathrm{mm}^{2}$
$\sigma_{h}=\frac{p d}{2 t}$
$\therefore 380=\frac{p \times 60}{2 \times 2}$
$\therefore \mathbf{p}=25.33 \mathrm{Mpa}$
1.(e) Find the maximum power that can be transmitted through a $50 \mathbf{~ m m}$ diamter shaft at $150 \mathbf{r p m}$, if the maximum permissible shear stress in the shaft is $80 \mathrm{~N} / \mathrm{mm}^{2}$.

Polar moment of inertia $=\frac{\pi d^{4}}{32}=613.59 \times 10^{3}$
Using torsional formula,

$$
\frac{T}{J}=\frac{\tau}{R}
$$

$\therefore \mathrm{T}=1.963 \times 10^{3} \mathrm{~N}-\mathrm{m}$
Now, power transmitted, $\mathrm{P}=\frac{2 \pi N T}{60}$

$$
\begin{aligned}
& \therefore P=30.84 \times 10^{3} \text { watt } \\
& \therefore \mathbf{P}=\mathbf{3 0 . 8 4} \mathbf{~ k W}
\end{aligned}
$$

2.(a) A beam weighing 450 N is held horizontal by three vertical wires, one attached to the middle of the beam and the others to the ends of the beam. The outer wires are of brass with 1.25 mm diameter and the central wire is of steel with $\mathbf{0 . 6 2 5} \mathbf{~ m m}$ diameter. Estimate the stresses induced in the wires, assuming that the beam is rigid and the wires are of same length and unstretched before attaching to the beam. Take Young's moduli of brass as $8.6 \times 10^{4} \mathrm{~N} / \mathrm{mm}^{2}$ and of steel as $2.1 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$.
$\mathrm{E}_{\text {steel }}=2.1 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$
$E_{\text {brass }}=8.6 \times 10^{4} \mathrm{~N} / \mathrm{mm}^{2}$
$\delta 1_{\mathrm{s}}=\frac{\mathrm{l}_{\mathrm{s}} \times \sigma_{\mathrm{s}}}{\mathrm{E}_{\mathrm{s}}}$
Similarly, $\delta l_{\mathrm{b}}=\frac{\mathrm{l}_{\mathrm{b}} \times \sigma_{\mathrm{b}}}{\mathrm{E}_{\mathrm{b}}}$

Since increase in the length of steel and brass wire is equal, therefore equating equations,
$\frac{\mathrm{l}_{\mathrm{s}} \times \sigma_{\mathrm{s}}}{2.1 \times 10^{5}}=\frac{\mathrm{l}_{\mathrm{b}} \times \sigma_{\mathrm{b}}}{8.6 \times 10^{4}}$
$\therefore \sigma_{\mathrm{s}}=2.442 \sigma_{\mathrm{b}}$
Load supported by the three wires $=450 \mathrm{~N}$
$\therefore 450=\sigma_{s} \mathrm{~A}_{\mathrm{s}}+\sigma_{\mathrm{b}} \mathrm{A}_{\mathrm{b}}$
$\therefore 450=1.98 \sigma_{\mathrm{b}}$
$\therefore \sigma_{\mathrm{b}}=227.27 \mathrm{MPa}$
$\therefore \sigma_{\mathrm{s}}=555 \mathrm{MPa}$
2.(b) At a point in a material under stress, the intensity of the resultant stress on certain plane is $50 \mathrm{~N} / \mathrm{mm}^{2}$ inclined at $30^{\circ}$ to the normal of that plane. The stress on a plane at right angles to this has a tensile component of intensity $30 \mathrm{~N} / \mathrm{mm}^{2}$. Find:
(i) The resultant stress on the second plane
(ii) The principle plane and stresses
(iii) Plane of maximum shear and intensity

From the given data, we first complete the figure indicating the stresses acting at a point.

From figure,
$\sigma_{\mathrm{x}}=43.30 \mathrm{~N} / \mathrm{mm}^{2}$
$\sigma_{\mathrm{y}}=30 \mathrm{~N} / \mathrm{mm} 2$
$\tau_{\mathrm{xy}}=25 \mathrm{~N} / \mathrm{mm}^{2}$
(i)Resultant stresses on second plane

(ii)To find principal stresses $\mathbf{P} 1$ and $P 2$ and their directions $\theta_{1}$ and $\boldsymbol{\theta}_{\mathbf{2}}$

Using $\mathrm{P}_{1}, \mathrm{P}_{2}=\frac{\sigma_{\mathrm{x}}+\sigma_{\mathrm{y}}}{2} \pm \frac{1}{2} \sqrt{\left(\sigma_{\mathrm{x}}-\sigma_{\mathrm{y}}\right)^{2}+4 \tau_{\mathrm{xy}}{ }^{2}}$
$\therefore$ Puting the values, we get,
$P_{1}=62.52 \mathrm{~N} / \mathrm{mm}^{2}$
$P_{2}=10.78 \mathrm{~N} / \mathrm{mm}^{2}$
Using $\tan 2 \theta=\frac{2 \tau_{\mathrm{xy}}}{\sigma_{\mathrm{x}}-\sigma_{\mathrm{y}}}$

$$
\therefore \theta=37.55
$$

$\theta_{2}=\theta_{2}+90=127.55^{\circ}$
(iii)To find maximum shearing stress and their directions

Using, $\tau_{\text {max }}= \pm \frac{\boldsymbol{P}_{1}-\boldsymbol{P}_{2}}{2}= \pm \mathbf{2 5 . 8 7 N} / \mathbf{m m}^{2}$
$\theta_{3}=\theta_{1}+45=82.55^{\circ}$
$\theta_{4}=\theta_{3}+90=172.55^{\circ}$
3.(a) For the beam shown draw S.F. and B.M. diagram and mark important points.

Step 1: Support Reactions
$\sum M=0$
$-417.5+282.5+\left(120 \sqrt{2} \sin 45^{\circ}\right) \times 5+(7.5 \times 10)(5+10)-V_{D} \times 20=0$
$\therefore-\mathrm{V}_{\mathrm{D}}=79.5 \mathrm{kN}$
$\sum F=0$
$\therefore \mathrm{V}_{\mathrm{A}}=115.5 \mathrm{kN}$
Step 2: Shear force calculations

$\mathrm{SF}_{\mathrm{AL}}=0$
$\mathrm{SF}_{\mathrm{AR}}=115.5 \mathrm{kN}$
$\mathrm{SF}_{\mathrm{BL}}=115.5-\left(120 \sqrt{2} \sin 45^{\circ}\right)=-4.5 \mathrm{kN}$
$\mathrm{SF}_{\mathrm{C}}=-4.5 \mathrm{kN}$
$\mathrm{SF}_{\mathrm{DL}}=-4.5-7.5 \times 10=-79.5 \mathrm{kN}$
$\mathrm{SF}_{\mathrm{DR}}=-79.5+79.5=0$

Step 3: Bending moment calculation
$\mathrm{BM}_{\mathrm{AL}}=0$
$\mathrm{BM}_{\mathrm{AR}}=-417.5 \mathrm{kNm}$
$\mathrm{BM}_{\mathrm{B}}=-417.5+115.5 \times 5=160 \mathrm{kNm}$
$\mathrm{BM}_{\mathrm{C}}=-417.5+115.5 \times 10-\left(120 \sqrt{ } 2 \sin 45^{\circ}\right) \times 5=137.5 \mathrm{kNm}$
$B M_{D L}=-417.5+115.5 \times 20-\left(120 \sqrt{ } 2 \sin 45^{\circ}\right) \times 15-7.5 \times \frac{10^{2}}{2}=-285.5 \mathrm{kN}$
$B M_{D R}=-285.5+285.5=0$
Step 4: Shear force and Bending moment diagram

Step 5: Point of Contraflexure
Consider BMD between portion AB by similarity of triangles,
$\frac{x_{1}}{417.5}=\frac{5-x_{1}}{160}$
$\therefore \mathrm{x}_{1}=3.6 \mathrm{~m}$ from point A
Now consider a section at distance $\mathrm{x}_{2}$ from pt. D

$$
\mathrm{BM}_{\mathrm{xx}}=0
$$

$-282.5+79.5 \mathrm{x}_{2}-7.5 \frac{x_{2}^{2}}{2}=0$

## $\therefore x_{2}=4.52 \mathrm{~m}$ from point $D$

3.(b) Determine the slope and deflection at the free end of the beam loaded as shown. $E=200 \mathrm{GPa}, \mathrm{I}=14 \times 10^{6} \mathrm{~m}^{4}$

Let $\mathrm{R}_{\mathrm{A}}$ and $\mathrm{R}_{\mathrm{D}}$ are the support reaction at A and D .
$\sum M_{A}=0$
$-\mathrm{R}_{\mathrm{D}} \mathrm{x} 4+100+(100 \mathrm{x} 2)(1+2)+200 \times 7=0$
$\therefore \mathrm{R}_{\mathrm{D}}=525 \mathrm{kN}$
$\sum F_{y}=0$
$\mathrm{R}_{\mathrm{A}}+\mathrm{R}_{\mathrm{D}}-100 \times 2-200=0$
$\mathrm{R}_{\mathrm{A}}=125 \mathrm{kN}$

EI $\frac{\mathrm{d}^{2} \mathrm{y}}{\mathrm{dx}^{2}}=-\left.125 x\right|_{0} ^{1}+\left.100(x-1)^{0}\right|_{0} ^{2}-\left.\frac{100(x-2)^{2}}{2}\right|_{0} ^{4}+525(x-4)-\left.\frac{100(x-4)}{2}\right|_{0} ^{7}$
Slope Equation
EI $\frac{\mathrm{dy}}{\mathrm{dx}}=\mathrm{C}_{1}-\left.\frac{125 x^{2}}{2}\right|_{0} ^{1}+\left.100(\mathrm{x}-1)\right|_{0} ^{2}-\left.\frac{100(x-2)^{3}}{6}\right|_{0} ^{4}+\frac{525(x-4)^{2}}{2}-\left.\frac{100(x-4)^{3}}{6}\right|_{0} ^{7}$
Deflection equation
EI.y $=\mathrm{C}_{1} \mathrm{X}+\mathrm{C}_{2}-\left.\frac{125 x^{3}}{6}\right|_{0} ^{1}+\left.\frac{100(x-1)^{2}}{2}\right|_{0} ^{2}-\left.\frac{100(x-2)^{4}}{24}\right|_{0} ^{4}+\frac{525(x-4)^{3}}{6}-\left.\frac{100(x-4)^{4}}{24}\right|_{0} ^{7}$
At $\mathrm{x}=0, \mathrm{y}=0 \therefore \mathrm{C}_{2}=0$
At $\mathrm{x}=4, \mathrm{y}=0 \therefore \mathrm{C}_{1}=-237.5$
i)To find deflection at point $E$, substituting $x=7$ in deflection

EI.y $=(-237.5)(7)+0-\frac{125(7)^{3}}{6}+\frac{100(7-1)^{2}}{2}-\frac{100(7-2)^{4}}{24}+\frac{525(7-4)^{3}}{6}-\frac{100(7-4)^{4}}{24}$
$\therefore y=-2.709 \times 10^{-15}$
(ii) To find slope at end A

Substituting $x=7$ in slope equation.
$\mathrm{EI} \frac{\mathrm{d}^{2} \mathrm{y}}{\mathrm{dx}^{2}}=(-237.5)-\frac{127\left(7^{2}\right)}{2}+100(7-1)-+\frac{525(7-4)^{2}}{2}-\frac{100(7-4)^{2}}{6}$
$E I \frac{d y}{d x}=-2870.83$
$\therefore \frac{\mathrm{dy}}{\mathrm{dx}}=1.025 \times 10^{-15}$ radians
4.(a) A rectangular pier is subjected to a compressive load of 450 kN as shown in the figure. Find the stress intensities at the four corners of the pier.

$\mathrm{A}=\mathrm{b} \times \mathrm{d}=1 \times 1.5=1.5 \mathrm{~m}^{2}$
and moment of Inertia of the pier about $\mathrm{x}-\mathrm{x}$ axis
$\mathrm{I}_{\mathrm{xn}}=\frac{b d^{3}}{12}=0.125 \mathrm{~m}^{4}$
Similarly, $\mathrm{I}_{\mathrm{y}}=0.281 \mathrm{~m}^{4}$
We also know that moment due to eccentricity or load along $\mathrm{x}-\mathrm{x}$ axis.
$\mathrm{M}_{\mathrm{x}}=\mathrm{P} . \mathrm{e}_{\mathrm{x}}=450 \times 0.25=112.5$
$M_{y}=P . e_{y}=450 \times 0.25=112.5$
From geometry of the loading, we find that distance between $y-y$ axis and the corners D and C
$\mathrm{x}=\frac{1.5}{2}-0.75=0.75 \mathrm{~m}$
Similarly, distance between x -x axis and the corner D and A
$\mathrm{y}=\frac{1}{2}=0.5 \mathrm{~m}$
From above we can calculate stresses at each corner as follows,
$\sigma=\sigma_{o} \pm \sigma_{\mathrm{bxx}} \pm \sigma_{\mathrm{yy}}$
$\sigma_{\mathrm{A}}=\sigma_{\mathrm{o}}-\sigma_{\mathrm{bxx}}-\sigma_{\mathrm{yy}}=300-450-300=\mathbf{- 4 5 0} \mathbf{~ k N} / \mathbf{m}^{\mathbf{2}}$
$\sigma_{\mathrm{B}}=\sigma_{\mathrm{o}}-\sigma_{\mathrm{bxx}}+\sigma_{\mathrm{yy}}=300-450+300=\mathbf{1 5 0} \mathbf{~ k N} / \mathbf{m}^{2}$
$\sigma_{\mathrm{C}}=\sigma_{\mathrm{o}}+\sigma_{\mathrm{bxx}}+\sigma_{\mathrm{yy}}=300+450+300=\mathbf{1 0 5 0} \mathbf{~ k N} / \mathbf{m}^{2}$
$\sigma_{\mathrm{D}}=\sigma_{\mathrm{o}}+\sigma_{\mathrm{bxx}}-\sigma_{\mathrm{yy}}=300+450-300=\mathbf{4 5 0} \mathbf{~ k N} / \mathbf{m}^{2}$
4.(b) Internal diameter of a hollow shaft is 0.6 of its external diameter. It has to transmit 300 kW power at 80 rpm . If the shear stress is not to exceed $60 \mathrm{~N} / \mathrm{mm}^{2}$, find the internal and external diameters of the shaft, assuming that the maximum torque is $\mathbf{1 . 4}$ times the mean torque.

Hollow shaft with internal diameter (d) and outer diameter(D)

$$
0.6 \mathrm{D}=\mathrm{d} \quad \tau_{\mathrm{s}}=60 \mathrm{~N} / \mathrm{mm}^{2}
$$

$\mathrm{T}_{\text {max }}=1.4 \mathrm{~T}_{\text {mean }} \quad \mathrm{P}=300 \mathrm{~kW}$
Now, $\mathrm{P}=\frac{2 \pi N T}{60}$
$\mathrm{P}=300 \times 10^{3}$ watts $\quad \mathrm{N}=80 \mathrm{rpm}$
Putting these values, we get
$\mathrm{T}_{\text {mean }}=35809.86 \mathrm{~N}-\mathrm{m}$
$\therefore \mathrm{T}_{\text {max }}=1.4 \times 35809.86=50133.80 \times 10^{3} \mathrm{~N}-\mathrm{mm}$

For hollow shaft torque transmitted is given by
$\therefore \mathrm{T}=\frac{\pi}{16} \cdot \tau_{\mathrm{s}}\left(\frac{D^{4}-d^{4}}{D}\right)$
$=\frac{\pi}{16} .(60)\left(\frac{D^{4}-(0.6 D)^{4}}{D}\right)$
$\therefore \mathrm{D}=169.72 \mathrm{~mm}$
$\therefore . \mathrm{d}=101.83 \mathrm{~mm}$
5.(a) A 200 kg weight is dropped on to a collar at the lower end of a vertical bar of $\mathbf{3 ~ m}$ long and 28 mm diameter. Calculate the height of drop, if the maximum instantaneous stress is not exceeding $120 \mathrm{~N} / \mathrm{mm}^{2}$. What is the corresponding instantaneous elongation? Take $\mathrm{E}=2 \mathrm{x} 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$. (10)

Ans.
Given: Weight=200 $\mathrm{kg}=200 \times 9.81=91==1962 \mathrm{~N}$

Dig of $\operatorname{rod}(d)=28 \mathrm{~mm}$
Length of $\operatorname{rod}(1)=3 \mathrm{~m}=3000 \mathrm{~mm}$
$\mathrm{E}=2 \times 10^{5} \mathrm{~N} / \mathrm{mm} 2$
oinstantaneous $=120 \mathrm{~N} / \mathrm{mm} 2$
Instantaneous stress for rod is given by,
$\sigma=\frac{P}{A}\left(1+\sqrt{1+\frac{2 E A h}{P L}}\right)$
$120=\frac{1962}{\frac{\pi}{4}(28)^{2}}\left(1+\sqrt{\left.1+\frac{(2)\left(2 \times 10^{5}\right)\left(\frac{\pi}{4} \times 28^{2}\right) h}{1962 \times 3000}\right)}\right.$
$\mathrm{h}=32 \mathrm{~mm}$
Now, $\mathrm{E}=\frac{\text { stress }}{\text { strain }}$
$\left(2 \times 10^{5}\right)=\frac{120}{e}$
$e=\frac{120}{2 \times 10^{5}}$
$e=6 \times 10^{-4}$
Let, instantaneous elongation $=(\delta t)$
$e=\frac{\delta t}{3000} \quad \delta t=1.8 \mathrm{~mm}$
$\underline{\text { Instantaneous elongation }(\delta t)=1.8 \mathrm{~mm}}$
5.(b) A simply supported beam, with a span of 1.3 m and a rectangular cross section of 1.3 m and a rectangular cross section of 150 mm wide and 250 mm deep, carries a concentrated load of $W$ at center. If the allowable stresses are $7 \mathrm{~N} / \mathrm{mm} 2$ for bending and $1 \mathrm{~N} / \mathrm{mm} 2$ for shear, what is the value of the safe load W?

Shear force and bending moment diagrams of given beam is as shown in the figure.
The maximum shear force $=\frac{W}{2} N$

The maximum $\mathrm{BM}=\frac{W L}{4} \mathrm{Nm}$
$\sigma_{b}=7 \mathrm{~N} / \mathrm{mm}^{2}$
$\tau=1 \mathrm{~N} / \mathrm{mm}^{2}$
Bending Stress criteria:
Using bending equation,
$\frac{\sigma_{b}}{y_{\max }}=\frac{M_{\max }}{F}$
$I=\frac{b d^{3}}{12}=\frac{150 \times 250^{3}}{12}$
$\mathrm{I}=195.31 \times 10^{6} \mathrm{~mm}^{4}$
$y_{\text {max }}=\frac{250}{2}=125 \mathrm{~mm}$
$\frac{7}{125}=\frac{W\left(1.3 \times 10^{3}\right)}{\frac{4}{195.31 \times 10^{6}}}$
$\mathrm{W}=33653.84 \mathrm{~N}$
$\mathrm{W}=33.65 \mathrm{kN}$
Shear Stress Criteria:
Maximum shear force in beam $=\mathrm{W} / 2$
Cross-section area of beam $=150 \times 250=375000 \mathrm{~mm}^{2}$
Average shear stress $=\frac{\text { shear force }}{\text { shear area }}$
$\tau_{a v g}=\frac{W / 2}{37500}=\left(1.33 \times 10^{-5}\right) W$
In a rectangular beam section, the maximum shear stress should not exceed 1 MPa

Therefore, (2 x 10-5) $\mathrm{W}=1$
$\mathrm{W}=50000 \mathrm{~N}$
$\mathrm{W}=50 \mathrm{kN}$
Maximum safe load is there for minimum of above two results
$\mathrm{W}=33.65 \mathrm{kN}$
6.(a) A hollow cast iron column of $\mathbf{2 0 0} \mathbf{~ m m}$ external diameter $\mathbf{1 5 0} \mathbf{~ m m}$ internal diameter and a 8 m long has both ends fixed. It is subjected to axial compressive load. Taking factor of safety as $6, \sigma_{c}=560 \mathrm{~N} / \mathrm{mm}^{2}, \alpha=$ $\frac{1}{1600}$, determine the safe Rankine load.
$\mathrm{D}=200 \mathrm{~mm}$ d=150mm
$\mathrm{L}=8 \mathrm{~m}=800 \mathrm{~mm}$
Column is fixed at both ends
$\mathrm{L}_{\mathrm{e}}=\frac{\mathrm{L}}{2}=4000 \mathrm{~mm}$
$\sigma_{\mathrm{c}}=560 \mathrm{~N} / \mathrm{mm}^{2} \quad$ FOS $=6$
M.I. $=\frac{\pi}{64}\left(\mathrm{D}^{4}-\mathrm{d}^{4}\right)=53.68 \times 10^{6} \mathrm{~mm}^{4}$

Area $=\frac{\pi}{4}\left(D^{2}-\mathrm{d}^{2}\right)=13.74 \times 10^{3} \mathrm{~mm}^{2}$
$\mathrm{K}=\sqrt{\frac{I}{A}}=\sqrt{\frac{53.68 \times 10^{6}}{13.74 \times 10^{3}}}=62.50 \mathrm{~mm}$
$\therefore$ Rankine crippling load $=\frac{\sigma_{c} \cdot \mathrm{~A}}{1+\alpha\left(\frac{\mathrm{Le}}{\mathrm{k}}\right)^{2}}=360.21 \mathrm{kN}$
$\therefore$ Safe Rankine Load $=\mathbf{3 6 0 . 2 1} \mathbf{k N}$
6.(b) A weight pf 200 kN is supported by three adjacent short pillars in a row, ecah $500 \mathrm{~mm}^{2}$ in second. The central pillar is made of steel and the outer ones are of copper. The pillars are adjusted such that $15^{\circ} \mathrm{C}$ each carries equal load. The temperature is then raised to $115^{\mathbf{}} \mathrm{C}$. Estimate the stresses in each pillar at $15^{\circ} \mathrm{C}$ and $115^{\circ} \mathrm{C}$.

Take $E_{S}=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2} \mathrm{E}_{\mathrm{C}}=0.8 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$

$$
\alpha_{\mathrm{s}}=1.2 \times 10^{5} /{ }^{0} \mathrm{C} \quad \alpha_{\mathrm{c}}=1.85 \times 10^{5} /{ }^{0} \mathrm{C}
$$

$\mathrm{P}=200 \mathrm{kN}=200 \times 10^{3} \mathrm{~N}$
Now, $\delta 1_{s}=\delta 1_{c}$
$\therefore \frac{\sigma_{\mathrm{S}} . l}{2 \times 10^{5}}=\frac{\sigma_{\mathrm{c}} . l}{0.8 \times 10^{5}}$
$\therefore \sigma_{\mathrm{s}}=2.5 \sigma_{\mathrm{c}}$

Also,
$200 \times 10^{3}=\sigma_{s} \mathrm{~A}_{\mathrm{s}}+\sigma_{\mathrm{c}} \mathrm{A}_{\mathrm{c}}$
Putting the values of $\sigma_{s}$ and $\mathrm{A}_{s}, \mathrm{~A}_{\mathrm{c}}$
We get,
$\sigma_{\mathrm{c}}=114.28 \mathrm{~N} / \mathrm{mm}^{2}$
$\therefore \sigma_{\mathrm{s}}=285.7 \mathrm{~N} / \mathrm{mm}^{2}$
Stresses before the rise in temp $=285.7 \mathrm{~N} / \mathrm{mm}^{2}$
When temperature is increased,
Force in steel $=$ Force in copper
$P_{s}=P_{c}$
$\therefore \sigma_{\mathrm{s}} \mathrm{A}_{\mathrm{s}}=\sigma_{\mathrm{c}} \mathrm{A}_{\mathrm{c}}$
Now, $\mathrm{A}_{\mathrm{s}}=\mathrm{A}_{\mathrm{c}}$
$\therefore \sigma_{\mathrm{s}}=\sigma_{\mathrm{c}}$
Now,
$\frac{\sigma_{\mathrm{s}}}{\mathrm{E}_{\mathrm{s}}}+\frac{\sigma_{\mathrm{c}}}{\mathrm{E}_{\mathrm{c}}}=\mathrm{t}\left(\alpha_{\mathrm{c}}-\alpha_{\mathrm{s}}\right)$
Putting the respective values, we get
$\sigma_{\mathrm{c}}\left(1.75 \times 10^{-5}\right)=6.5 \times 10^{-4}$
$\therefore \sigma_{\mathrm{c}}=37.14=\sigma_{\mathrm{s}}$
