Q.P. 70863

## STRENGTH OF MATERIALS

(DEC 2019 SEM3 MECHANICAL)

## Q1)

a) Derive an expression for the strain energy due to suddenly applied load. (5)

Ans: Consider a member of length L , cross-sectional area A
And subjected to suddenly applied load P. let the instantaneous
Deformation of member be $\delta L_{s}$ and the corresponding
Instantaneous stress developed be $f_{s}$. The load verses deformation
Curve would be a straight line.
Now work done by the load
$=$ area under load-deformation curve.
$=P \mathrm{x} \delta L_{s}$.
We know strain energy $\mathrm{U}=$ work done.

$$
\begin{align*}
& U=P \times \delta L_{S} . \\
& U=\frac{f^{2} A L}{2 E} . \\
& P \times \delta L_{s}=\frac{f_{S}^{2} A L}{2 E} . \\
& f_{S}=\frac{2 P}{A} . \quad \ldots \ldots . \tag{1}
\end{align*}
$$

But stress due to gradually applied load $=\mathrm{f}=\frac{P}{A}$.

$$
\begin{equation*}
f_{s}=2 \mathrm{f} \tag{2}
\end{equation*}
$$

Also $\delta L_{s}=2 \delta L$.
Equations 1 and 2 indicate that sudden loads produce twice the stress thereby resulting in twice the strains as compared to the same loads when gradually applied.

## b) Derive the relation between load, shear force and bending moment

Fig. (a) shows a beam carrying a general loading. Consider an element of the beam formed by taking two cutting sections $m-m$ and $n-n$ distance $d x$ apart. The general loading over the element can be assumed to be a u.d.l. of intensity w per unit run since dx is very small.
On the right face of the element the shear resistance force V and moment resistance M is developed. On the left face the shear resistance force has an increment of dV and becomes V + DV, while the moment resistance M increases by dM and becomes $\mathrm{M}+\mathrm{dM}$. Since the beam is in equilibrium, an element of the beam must also be in equilibrium.
Applying Conditions of Equilibrium to the element
Using Fy $=0 \uparrow+\mathrm{ve}$
$(\mathrm{v}+\mathrm{dV})-\mathrm{V}-\mathrm{wdx}=0$
$\therefore \mathrm{dV}=\mathrm{wdx}$ or $\frac{\mathrm{dv}}{\mathrm{dx}}=\mathrm{W}$ $\qquad$
Equation 1 implies that the rate of change of shear force at any section represents the rate of loading at that section.
Now using $\Sigma \mathrm{M}=0 \quad \boldsymbol{+}+$ ve
Taking moments about section $\mathrm{m}-\mathrm{m}$
$(\mathrm{M}+\mathrm{dM})-\mathrm{M}-\mathrm{V} \mathrm{dx}-(\mathrm{wdx}) \mathrm{x} \frac{d X}{2}=0$.
$\mathrm{dM}-\mathrm{V} \mathrm{dx}-\mathrm{w} \frac{(d X)^{2}}{2}=0$.
The square of a small quantity can be neglected, we therefore have
$d M=V d x$ or $\frac{d M}{d x}=V$ $\qquad$ 2

Equation 2 implies that the rate of change of bending moment at any section represents the shear force at that section.

## c) Write the assumptions made in theory of pure torsion and derive torsional formula.

Ans: Assumptions made in pure torsion theory:

- The material of the shaft is homogenous and isentropic throughout its length.
- Circular sections remains circular and planar.
- The twisting moment $T$ acts in a plane perpendicular to the shaft axis.
- At any section, the radial lines remain straight.
- Hooke's law is valid.

## Derivation of Torsion Equation

Consider a solid cylindrical shaft of radius R and length L be subjected to an equal and opposite twisting torques of magnitude T at the ends of the shaft such that the axis of the torques coincide with the shaft axis o-o. The shaft is therefore in pure torsion.

Consider a straight fibre AB on the surface of the shaft and parallel to the shaft axis o-o. Now on application of the twisting torque $T$, the initially straight fibre AB gets twisted into a helix AC . The corresponding angle $\mathrm{BAC}=\phi$ represents the shear strain of the fibre. Let $\tau$ be the corresponding shear stress developed in the fibre.
Shear strain of the fibre $=\theta=\frac{B C}{L}$.
Now let $\theta$ be the angular movement of the radial line OB to new position OC . From geometry $\operatorname{Arc} \mathrm{BC}=\mathrm{R} \times \theta$.
.$:$ Shear strain of the fibre $=\Theta=\frac{R x \theta}{L}$.
We know, Modulus of Rigidity $\mathrm{G}=\frac{\text { shear stress }}{\text { shear strain }}$. $\mathrm{G}=\frac{\tau}{\phi}$.
$\tau=$ G. $\phi$

$\tau=\operatorname{Gx} \frac{R x \Theta}{L}$.
$\frac{\tau}{R}=\frac{\mathrm{G} \cdot \Theta}{L} \ldots \ldots \ldots \ldots$ (1)
consider a cutting section $m-m$ taken to cut the shaft into two parts. Consider the equilibrium of the left part of the shaft.

Now consider an elemental area dA at a distance r from o subjected to shear stress q. Let $\tau$ be the shear stress in a fibre on the shaft surface i.e.at distance R from o . we know that the shear stress distribution along the radial line varies linearly with the radial distance from the axis of the shaft.
Shear stress on the elemental area $=\frac{\mathrm{q}}{}=\frac{r}{R} \mathrm{x} \tau$.
Hence, shear resistance force developed by elemental area $=\mathrm{qdA}=\frac{r}{R} \mathrm{x} \tau$ dA.
Now. Moment of resistance developed by the elemental area $=\frac{r}{R} \mathrm{x} \tau \mathrm{dAx}$.
Total moment of resistance offered by the cross section of the shaft

$$
=\frac{\tau}{R} \int r^{2}=\frac{\tau}{R} \times J .
$$

Here, $\int r^{2} d A=J$ is the polar moment of inertia of the shaft section about the axis of the shaft.
Now
Torque transmitted by shaft $=$ Moment of resistance $t$ developed in the Shaft

$$
\begin{align*}
& \mathrm{T}=\frac{\mathrm{T}}{\mathrm{R}} \times \mathrm{J} \\
& \frac{\mathrm{~T}}{\mathrm{R}}=\frac{\mathrm{I}}{\mathrm{~J}} \ldots \ldots . \tag{2}
\end{align*}
$$

Comparing eqn 1 and 2 , we get

$$
\frac{\tau}{\mathrm{R}}-\frac{\mathrm{T}}{\mathrm{~J}}=\frac{\mathrm{G} \theta}{\mathrm{~L}}
$$

Above equation is referred to as the equation for pure torsion.
d) Draw shear stress distribution diagram for symmetry I section, T section and rectangular section.
Ans: 1. Rectangular Section.
Consider a rectangular section of dimensions' $\mathrm{b} x \mathrm{~d}$.
The N.A passes through the centroid at $\mathrm{d} / 2$ from the base.
Consider a layer $\mathrm{m}-\mathrm{m}$ at distance y from the N.A.
area above layer $m-m, A=b x\left(\frac{d}{2}-y\right)$
Distance of the centroid of shaded area from N.A,

$$
\begin{aligned}
\bar{y} & =y+\frac{1}{2}\left(\frac{d}{2}-y\right) \\
& =\frac{\mathrm{y}}{2}+\frac{\mathrm{d}}{4}=\frac{1}{2}\left(\frac{\mathrm{~d}}{2}+\mathrm{y}\right)
\end{aligned}
$$

Using shear stress equation

$$
\begin{gather*}
\tau=\frac{\mathrm{v} \times(\mathrm{Ax} \overline{\mathrm{y}})}{\mathrm{I} \cdot \mathrm{~b}} . \\
\tau_{\mathrm{m}-\mathrm{m}}=\frac{\mathrm{v}\left[\mathrm{~b}\left(\frac{\mathrm{~d}}{2} \times \mathrm{xy}\right) \times \frac{1}{2}\left(\frac{\mathrm{~d}}{2}+\mathrm{y}\right)\right]}{\frac{\mathrm{bd}^{3}}{12} \times \mathrm{b}} . \\
\quad \tau_{\mathrm{m}-\mathrm{m}}=\frac{6 \mathrm{~V}}{\mathrm{bd}^{3}}\left(\frac{\mathrm{~d}^{2}}{4}-\mathrm{y}^{2}\right) . \tag{1}
\end{gather*}
$$

General relation for shear stress

The above equation indicates parabolic nature of shear stress variation
At top and bottom edge $\mathrm{y}=\frac{d}{2} \quad, \tau=0$.
Also $\tau$ would be maximum when $\mathrm{y}=0$
$\bar{\tau}_{\text {max }}=\frac{3 \mathrm{v}}{2 \mathrm{bd}} \quad$... (2) Relation for maximum shear stress
For a rectangular section (bxd) subjected to vertical shear V.
Average shearing stress $=\tau_{\text {average }}=\frac{\text { shear force }}{\text { shear area }} . \quad \tau_{\text {average }}=\frac{V}{b X d}$
From equations (2) and (3)

$$
\begin{equation*}
\tau_{\max }=1.5 \tau_{\text {average }} \tag{3}
\end{equation*}
$$

This shows that for a rectangular section the maximum shear stress which occurs at the NA is 1.5 times the mean or average shear stress resisted by the section.

## 2. symmetry I section

Consider a symmetrical I section of flange width $b$, Web width $b$, web depth $d$ and overall depth $D$.

The N>A passes through the centroid at $\mathrm{D} / 2$
From the base.
Shear stress analysis in the flange.
Consider a layer m-m at a distance y from N.A
Width of layer $\mathrm{m}-\mathrm{m}=\mathrm{B}$
area above layer $\mathrm{m}-\mathrm{m}, \mathrm{A}=\mathrm{B}\left(\frac{D}{2}-y\right)$.

Distance of centroid of shaded area from N.A

$$
C=\frac{\mathrm{D}}{2}-\frac{\left(\frac{\mathrm{D}}{2}-\mathrm{y}\right)}{2}=\frac{\left(\frac{\mathrm{D}}{2}+\mathrm{y}\right)}{2} .
$$

Using $\quad \tau=\frac{V X(A X V)}{I . b}$.
$\tau_{m-m(\text { flange })}=\frac{\mathrm{vxB}}{\mathrm{IxB}}\left(\frac{\mathrm{D}}{2}-\mathrm{y}\right) \frac{\left(\frac{\mathrm{D}}{2}+\mathrm{y}\right)}{2}$.
$\tau_{m-m(\text { flange })}=\frac{\mathrm{v}}{2 \mathrm{I}}\left(\frac{\mathrm{D}^{2}}{4}-\mathrm{y}^{2}\right) . \quad \ldots$ general relation for shear stress in flange.
Shear stress analysis in the web.
Consider a layer $\mathrm{n}-\mathrm{n}$ at a distance y from the N.A
Width of layer $\mathrm{n}-\mathrm{n}=\mathrm{b}$.
Shaded area above layer $\mathrm{n}-\mathrm{n}, \mathrm{A}=A_{1}+A_{2}$.
Where $A A_{1}=B\left(\frac{D}{2}-\frac{d}{2}\right)$ and $A_{2}=b\left(\frac{d}{2}-y\right)$
Distance of centroid of $A_{1}$ from N.A

$$
\overline{\mathrm{Y}}_{1}=\frac{D}{2}-\frac{1}{2}\left(\frac{D}{2}-\frac{d}{2}\right)=\frac{D}{4}+\frac{d}{4}=\frac{\frac{D}{2}+\frac{d}{2}}{2} .
$$

Distance of centroid $A_{2}$ from N.A $\bar{y}_{2}=y+\frac{\frac{d}{2}-y}{2}=\frac{y+\frac{d}{2}}{2}$.
Using $\tau=\frac{\mathrm{Vx}(\mathrm{A} \times \overline{\mathrm{y}})}{I . b}$.
Using $\tau_{n-n}=V \times \frac{A_{1} \times \bar{y}_{1}+A_{2} \times \bar{y}_{2}}{I . b}$.

$$
=\frac{\mathrm{v}}{\mathrm{Ib}}\left[\mathrm{~B}\left(\frac{\mathrm{D}}{2}-\frac{\mathrm{d}}{2}\right) \frac{\left(\frac{\mathrm{D}}{2}+\frac{\mathrm{d}}{2}\right)}{2}+\mathrm{b}\left(\frac{\mathrm{~d}}{\mathrm{z}}-\mathrm{y}\right) \frac{\left(\mathrm{y}+\frac{\mathrm{d}}{2}\right)}{2}\right] .
$$

$$
=\frac{V}{8 I b}\left[B\left(D^{2}-d^{2}\right)+b\left(d^{2}-4 y^{2}\right)\right] . \ldots \ldots \ldots . \text { general relation }
$$

for shear stress

The maximum shear stress is at $\mathrm{y}=0$ i.e. at N.A.

$$
\tau_{\max }=\frac{V}{8 I b}\left[B\left(D^{2}-d^{2}\right)+b^{2}\right] \ldots . . \text { relation for max shear stress. }
$$

Shear stress in flange at the flange and web junction i.e. at $y=\frac{d}{2}$.

$$
\tau_{J-J(\text { flange })}=\frac{V}{2 I}\left(\frac{D^{2}}{2}-\frac{d^{2}}{2}\right)=\frac{V}{8 I}\left(D^{2}-d^{2}\right) .
$$

Shear stress in web at the flange and web junction i.e. at $y=\frac{d}{2}$.

$$
\begin{align*}
\tau_{J-J(\text { web })} & =\frac{V}{8 I b}\left[B\left(D^{2}-d^{2}\right)+b\left(d^{2}-\frac{4 d^{2}}{4}\right)\right. \\
& =\tau_{J-J(\text { web })}=\frac{V}{8 I b}\left[B\left(D^{2}-d^{2}\right)\right] \ldots \tag{2}
\end{align*}
$$

From equations (1) and (2) we understand that the stress in web drastically increases by $\frac{B}{b}$ times the corresponding stress in the flange in the junction Layer J-J of flange and web.

## e) write the assumption for simple bending and derive and derive the flexural formula.

Ans: assumptions made in theory of simple bending:

- The material of beam is homogenous and isotropic.
- The beam is initially straight and all the longitudinal fibres bend in circular arcs with a common centre of curvature.
- Members have symmetric cross sections and are subjected to bending in the plane of symmetry.
- The beam is subjected to pure bending and the effect of shear is neglected.
- Plane(transverse) sections through a beam taken normal to the axis of the beam remain plane after the beam is subjected to bending.
- The radius of curvature is large as compared to the dimensions of the beam.

Flexural formula:
Consider a beam section under pure sagging bending. Here the layers above The N.A are subjected to compressive forces. The magnitude of this Compressive force is proportional to the location of the layer from the N.A
similarly, the layers below the N.A are subjected to the tensile forces in all the Layers about the N.A is known as the moment of resistance of the section. The moment of resistance is a result of bending and is a resisting moment to The applied resistance is result of bending and is a resisting moment to the Applied bending moment.

We know that, force on layer $=\frac{E}{R} \cdot y \cdot d A$.
Moment of this force about N.A $=\frac{E}{R} \cdot y \cdot d A \cdot y$.

$$
=\frac{K^{K}}{R} \cdot y^{2} \cdot d A .
$$

Total moment of forces in different layers

$$
\begin{aligned}
=\text { moment of resistance } & =\int \frac{E}{R} \cdot y^{2} \cdot d A . \\
& =\frac{E}{R} \int y^{2} \cdot d A .
\end{aligned}
$$

If M is the external bending moment, then the moment of resistance should be equal to the bending M .

$$
M=\frac{E}{R} \int y^{2} \cdot d A
$$

But $\int y^{2} \cdot d A$. represents the second moment of area or the moment of inertia I Of the section about the N.A

$$
\begin{equation*}
M=\frac{E}{R} X I \quad \text { or } \frac{M}{I}=\frac{E}{R} \tag{1}
\end{equation*}
$$

But $\frac{f}{y}=\frac{E}{R}$
Comparing it with equation (1), we get.
$\frac{f}{y}=\frac{M}{I}=\frac{E}{R}$.
Since the stress f is due to bending we denote it as $f_{b}$ and would refer to it as Bending stress.
$\frac{f_{b}}{y}=\frac{M}{I}=\frac{E}{R} . \cdots \cdots$ equation of bending or flexure equation.
f) find the maximum power that can be transmitted through 50 mm diameter shaft at 150 rpm , if the maximum permissible shear stress is $80 \mathrm{~N} / \mathrm{mm}^{2}$.(5) Ans: $\mathrm{N}=150 \mathrm{rpm}$.
$\omega=\frac{2 \pi N}{60}=\frac{2 \pi \times 150}{60}=15.70 \mathrm{rad} / \mathrm{s}$.
$\mathrm{D}=50 \mathrm{~mm}$.
$\tau=80 \mathrm{~N} / \mathrm{mm}^{2}$.
Polar moment of inertia $J=\frac{\pi}{32} d^{4}$.
$\therefore J=\frac{\pi}{32} \times(50)^{4}$. $J=245.43 \mathrm{~mm}^{4}$.

Using torsions equations

$$
\frac{\tau}{R}=\frac{T}{J}
$$

$$
\frac{80}{25}=\frac{T}{245.43} .
$$

$\therefore \mathrm{T}=785.376 \mathrm{~N}-\mathrm{mm}$.
But

$$
\begin{aligned}
\mathrm{P} & =\mathrm{T} \times \omega \\
& =785.376 \times 15.70 \\
& =12330.4 \mathrm{~W} .
\end{aligned}
$$

Power developed by the shaft $=1.23 \mathrm{~kW}$

## Q.2)

a) A bar of brass 20 mm is enclosed in a steel tube of 40 mm external diameter and 20 mm internal diameter. The bar and the tubes are initially 1.2 mlong and are rigidly fastened at both ends. If the temperature is raised by $60^{\circ} \mathrm{C}$, find the Stresses induced in the bar and the tube.
Given: $E_{s}=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$.

$$
\begin{align*}
E_{b} & =1 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2} . \\
\alpha_{s} & =11.6 \times 10^{-6} /{ }^{\circ} \mathrm{C} \\
\alpha_{b} & =18.7 \times 10^{-6} /{ }^{\circ} \mathrm{C} \tag{10}
\end{align*}
$$

Ans:

Brass bar
$\mathrm{d}=20 \mathrm{~mm}$.
$\mathrm{L}=1.2 \mathrm{~mm}=1200 \mathrm{~mm}$.

$$
\mathrm{A}=\frac{\pi}{4} \times d^{2} .
$$

$$
=\frac{4}{4} \times(20)^{2} \text {. }
$$

$$
=314.15 \mathrm{~mm}^{2} \text {. }
$$

$E_{b}=1 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$.
$\alpha_{b}=18.7 \times 10^{-6} /{ }^{\circ} \mathrm{C}$.
$\mathrm{T}=60^{\circ} \mathrm{C}$.
Load sharing relation:
Force in steel tube $=$ force in brass bar.

$$
\begin{align*}
& \quad P_{s}=P_{b} . \\
& f_{s} A_{s}=f_{b} A_{b} . \\
& f_{s} \times 942.47=f_{b} \times 314.15 . \\
& f_{s}=0.333 f_{b} . \quad \ldots \ldots \ldots . . \tag{1}
\end{align*}
$$

Strain relation:

$$
\delta L_{\text {steel }}=\delta L_{\text {brass }} .
$$

$[\text { free expansion }+ \text { induced expansion }]_{\text {steel }}=$ $[\text { free expansion - induced contraction }]_{\text {brass }}$.

$$
\left[\alpha T L+\frac{P L}{A E}\right]_{\text {steel }}=\left[\alpha T L+\frac{P L}{A E}\right]_{\text {brass }} .
$$

$\left[\left(11.6 \times 10^{-6}\right) \times 60+\frac{f_{s}}{2 \times 10^{5}}\right]=\left[\left(18.7 \times 10^{-6}\right) \times 60-\frac{f_{b}}{10^{5}}\right]$.
$0.5 f_{s}+f_{b}=42.6$.
Substituting value of $f_{s}$ from eqn 1 in eqn 2 , we get.

$$
\begin{aligned}
& 0.5\left(0.333 f_{b}\right)+f_{b}=42.6 . \\
& f_{b}=36.51 \mathrm{~N} / \mathrm{mm}^{2} \\
& \\
& f_{s}=0.333 \times f_{b} \\
& f_{s}=0.333 \times 36.51 . \\
& f_{s}=12.15 \mathrm{~N} / \mathrm{mm}^{2} .
\end{aligned}
$$

b) the state of stress at a point in a strained material is as shown in fig. Determine
(1) the direction of principal planes.
(2) the magnitude of maximum shear stress .

Indicate the direction of all the above by a sketch.

Ans: given:

$$
\sigma_{x}=200 \mathrm{~N} / \mathrm{mm}^{2}
$$

$$
\begin{aligned}
& \sigma_{y}=150 \mathrm{~N} / \mathrm{mm}^{2} \\
& \tau_{x y}=100 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned} \quad \begin{aligned}
& \sigma_{1,2}=\left(\frac{\sigma_{x}+\sigma_{y}}{2}\right) \pm \sqrt{\left(\frac{\sigma_{x}-\sigma_{y}}{2}\right)^{2}+\tau_{x y}^{2}} \\
& \quad=175 \pm \sqrt{25^{2}+100^{2}} \\
& \quad=175 \pm 103.077 . \\
& \sigma_{1}=278.077 \mathrm{~N} / \mathrm{mm}^{2} \\
& \sigma_{2}=71.923 \mathrm{~N} / \mathrm{mm}^{2} \\
& \tau_{\max }=103.077 \mathrm{~N} / \mathrm{mm}^{2} \\
& \tan 2 \theta_{p}=\frac{2 \tau_{x y}}{\sigma_{1}-\sigma_{2}} . \\
& \tan 2 \theta_{p}=\frac{2 \times 100}{50}=4 . \\
& \therefore \theta_{p 1}=37.98^{\circ} \text { and } \theta_{p 2}=90+37.98=127.98^{\circ} .
\end{aligned}
$$

## Q3)

a) find slope at point $A$ and $B$, deflections at points $C$ and $D$ for a beam as shown in fig. also find the maximum deflection. Take $E=200 \mathrm{GPa}$ and $\mathrm{I}=10^{8} \mathrm{~mm}^{4}$.

Ans:

Finding support reactions:
Taking moment about point A: $\sum+$ ve.
$12 \times 3+5 \times 9-R_{B} \times 11=0$.
$\therefore R_{B}=7.36 \mathrm{kN}$.
$\sum F_{Y}=0 . \uparrow+\mathrm{ve}$.
$R_{A}+R_{B}-12-5=0$.
$R_{A}+7.36-12-5=0$
$\therefore R_{A}=9.64 \mathrm{kN}$.

Taking section $\mathrm{x}-\mathrm{x}$ near support A .
Distance of section $x-x$ from point $B=X$
Taking moment about section $\mathrm{x}-\mathrm{x}$.
$\therefore-R_{B} \times X+5 \times(X-2)+\frac{2(X-8)}{2} \times(X-8)=M_{x x}$
Now we have,
$E I \frac{d^{2} y}{d x^{2}}=M$
$E I \frac{d^{2} y}{d x^{2}}=-7.36 \times X+5 \times(X-2)+(X-8)^{2}$
Integrating both the sides w.r.t X , we get.
$E I \frac{d y}{d x}=-\frac{7.36 X^{2}}{2}+\frac{5(x-2)^{2}}{2}+\frac{(x-8)^{3}}{3}+c_{1} . \quad \ldots .$. (eqn for slope).
Integrating both sides w.r.t X , we get.
EI. $y=-\frac{7.36 X^{3}}{2 \times 3}+\frac{5(X-2)^{3}}{6}+\frac{(X-8)^{4}}{4}+C_{1} X+C_{2} . \quad \ldots .$. (eqn for deflection).
applying boundary conditions:
At $\mathrm{X}=0 \mathrm{y}=0$.
$E I . y=-\frac{7.36 X^{3}}{2 \times 3}+\frac{5(X-2)^{3}}{6}+\frac{(X-8)^{4}}{4}+C_{1} X+C_{2}$.
$\therefore E I(0)=0+0+C_{2}$
$\therefore C_{2}=0$.
Now
At $\mathrm{X}=11 \mathrm{y}=0$.
$E I . y=-\frac{7.36 X^{3}}{2 \times 3}+\frac{5(X-2)^{3}}{6}+\frac{(X-8)^{4}}{4}+C_{1} X+C_{2}$.
$0=-\frac{7.36(11)^{3}}{6}+\frac{5(6)^{3}}{6}+0+8 C_{1}+0$
$C_{1}=181.58$
Now slope equation :
$E I \frac{d y}{d x}=-\frac{7.36 X^{2}}{2}+\frac{5(X-2)^{2}}{2}+\frac{(X-8)^{3}}{3}+181.58$.
Slope at points A and B.
At point A X=0
$\therefore E I \frac{d y}{d x}=0+181.58$

$$
\begin{aligned}
\frac{\mathrm{dy}}{\mathrm{dx}} & =\frac{181.58}{E I} \\
& =\frac{181.58 \times 10^{9}}{200 \times 10^{8}}=9.079 \mathrm{rad}
\end{aligned}
$$

At point $\mathrm{B} X=11$
$E I \frac{d y}{d x}=-\frac{7.36(11)^{2}}{2}+\frac{5(11-2)^{2}}{2}+\frac{(11-8)^{3}}{3}+181.58$.
$\frac{\mathrm{dy}}{\mathrm{dx}}=-2.91 \mathrm{rad}$
Deflection:
$E I . y=-\frac{7.36 X^{3}}{2 \times 3}+\frac{5(X-2)^{3}}{6}+\frac{(X-8)^{4}}{4}+C_{1} X+C_{2}$.
Deflection at point C
$\mathrm{X}=6$
$E I . y=-\frac{7.36(6)^{3}}{2 \times 3}+\frac{5(6-2)^{3}}{6}+181.58 \times 6$
$\mathrm{y}=43.89 \mathrm{~mm}$.
Deflection at point D.
X=9
$E I . y=-\frac{7.36(9)^{3}}{2 \times 3}+\frac{5(9-2)^{3}}{6}+\frac{(1)^{4}}{4}+181.58 \times 6$
$\mathrm{y}=47.74 \mathrm{~mm}$.
maximum deflection .
$\mathrm{X}=\frac{11}{2}$
$E I . y=-\frac{7.36(5.5)^{3}}{2 \times 3}+\frac{5(5.5-2)^{3}}{6}+181.58 \times 6$
$y_{\max }=46.056 \mathrm{~mm}$.
b) draw $S F$ and $B M$ diagram for the beam shown in fig.
(10)

Ans:

Support reaction calculation:
$\sum M_{A}=0 \quad+\mathrm{ve}$.
$-20 \times 11+R_{B} \times 9-30-60 \times 4+40 \times 1=0$.
$R_{B}=50 k N$.
$\Sigma F_{y}=0 . \uparrow+\mathrm{ve}$.
$-40+R_{A}-60+R_{B}-20=0$.
$R_{A}=70 \mathrm{kN}$.

Shear force calculation: $\quad \downarrow \mid \uparrow$-ve
$S F_{F(J R)}=0$.
$S F_{F(J L)}=20 \mathrm{kN}$.
$S F_{B(J R)}=20 \mathrm{kN}$.
$S F_{B(J L)}=-R_{B}+20=-50+20=-30 k N$.
$S F_{D(J R)}=-30 k N$.
$S F_{D(J L)}=60-30=30 \mathrm{kN}$.
$S F_{A(J R)}=30 \mathrm{kN}$.
$S F_{A(J L)}=-70+30=-40 k N$.
Bending moment calculation $\supset+$ ve
$B M_{F}=0$.
$B M_{B}=-20 \times 2=-40$.
$B M_{E(J R)}=50 \times 2-20 \times 4=20$.
$B M_{E(J L)}=20-30=-10$.
$B M_{D}=-20 \times 7+50 \times 5-30$
$=80 \mathrm{kN}$.
$B M_{A}=-20 \times 11+50 \times 9-30-60 \times 4$.
$=-40$.

## Q4)

a) A vertical column of rectangular section is subjected to a compressive load of $P=800 \mathrm{kN}$ as shown in fig. find the stress intensities at the four corners of the column.

Ans: $e_{x x}=0.2 \mathrm{~m}=200 \mathrm{~mm}$.
$e_{y y}=0.6 \mathrm{~m}=600 \mathrm{~mm}$.
Direct stress $=\frac{P}{A}$.

$$
\begin{aligned}
& =\frac{800 \times 10^{3}}{2000 \times 1000} \\
& =0.4 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

Bending stress $f_{b x x}$ due to eccentricity w.r.t x axis:
$f_{b x x}= \pm \frac{P e_{x x} y_{x x}}{I_{x x}}$.

$$
\begin{aligned}
& I_{x x}=\frac{(b d)^{3}}{12}=\frac{2000 \times(1000)^{3}}{12}=16.6 \times 10^{10} \mathrm{~mm}^{4} \\
& f_{b x x}= \pm \frac{800 \times 10^{3} \times 200 \times 500}{16.66 \times 10^{10}} \\
& f_{b x x}= \pm 0.481 \mathrm{~N} / \mathrm{mm}^{2} .
\end{aligned}
$$

Bending stress $f_{\text {byy }}$ due to eccentricity w.r.t y axis:
$f_{b y y}= \pm \frac{P e_{x x} Y_{y y}}{I_{y y}}$.
$I_{y y}=\frac{b d^{3}}{12}=\frac{1000 \times(2000)^{3}}{12}=66.67 \times 10^{10} \mathrm{~mm}^{4}$.
$f_{b y y}= \pm \frac{800 \times 10^{3} \times 600 \times 1000}{66.67 \times 10^{10}}$
$f_{\text {byy }}= \pm 0.71 \mathrm{~N} / \mathrm{mm}^{\wedge} 2$. (side $\mathrm{CB}=+\mathrm{ve}$, side $\mathrm{AD}=-\mathrm{ve}$ ).

The resultant stresses at the corners would be addition of direct stress and bending stress along x any y axis.
$f_{R}=f_{d}+f_{b x x}+f_{b y y}$.
At corner A $f_{R A}=0.4+0.481-0.71=0.171 \mathrm{~N} / \mathrm{mm}^{2} \quad$ (compressive).
At corner $\mathrm{B} f_{R B}=0.4+0.481+0.71=1.591 \mathrm{~N} / \mathrm{mm}^{2} \quad$ (compressive).
At corner $\mathrm{C} f_{R C}=0.4-0.481+0.71=0.629 \mathrm{~N} / \mathrm{mm}^{2} \quad$ (compressive).
At corner $\mathrm{D} f_{R D}=0.4-0.481-0.71=-0.791 \mathrm{~N} / \mathrm{mm}^{2}$ (tensile).
b) a propeller shaft is required to transmit 50 kW power at 500 rpm . It is a hollow shaft, having an inside diameter 0.6 times of outside diameter and permissible shear stress for shaft material is $90 \mathrm{~N} / \mathrm{mm}^{2}$. Calculate the inside and outside diameters of the shaft.
Ans: $\mathrm{P}=50 \mathrm{Kw}=50 \times 10^{3} \mathrm{~W}$.
$\mathrm{N}=500 \mathrm{rpm}$.
$\omega=\frac{2 \pi N}{60}=52.35 \mathrm{rad} / \mathrm{s}$.
$d_{i}=0.6 \times d_{o}$.
$[\tau]=90 \mathrm{~N} / \mathrm{mm}^{2}$.
$d_{i}=$ ?
$d_{o}=$ ?
Polar moment of inertia $=J=\frac{\pi}{32}\left(d_{o}^{4}-d_{i}^{4}\right)$.

$$
\begin{aligned}
& J=\frac{\pi}{32}\left(d_{o}^{4}-\left(0.6 d_{o}\right)^{4}\right) \\
& J=0.085 d_{o}^{4}
\end{aligned}
$$

Using torsion equation.

$$
\frac{\tau}{R}=\frac{T}{J}
$$

$\frac{\frac{90}{d_{o}^{4}}}{2}=\frac{955.10}{0.085 d_{o}^{4^{4}}}$.
$d_{o}=3.966 \mathrm{~mm}$.
$d_{i}=0.6 \times 3.966=2.37 \mathrm{~mm}$.

## Q5)

a) A cylindrical shell is 3 m long and 1.2 m in diameter and 12 mm thick is Subjected to internal pressure of $1.8 \mathrm{~N} / \mathrm{mm}^{2}$ calculate change in dimensions and Volume of shell. Take $E=210 \mathrm{kN} / \mathrm{mm}^{2}, \mathbf{1 / m}=\mathbf{0 . 3}$.
Ans: given:
$\mathrm{L}=3 \mathrm{~m}=3000 \mathrm{~mm}$.
$\mathrm{d}=1.2 \mathrm{~m}=1200 \mathrm{~mm}$.
$\mathrm{t}=12 \mathrm{~mm}$.
$\mathrm{p}=1.8 \mathrm{~N} / \mathrm{mm}^{2}$.
$\mathrm{E}=210 \times 10^{3} \mathrm{~N} / \mathrm{mm}^{2}$.
$1 / \mathrm{m}=0.3$.
$\delta_{d}=$ ? (change in diameter).
$\delta_{L}=$ ? (change in length).
$\delta_{\mathrm{v}}=$ ? (change in volume).
Circumferential stress

$$
f_{c}=\frac{p d}{2 t}=\frac{1.8 \times 1200}{2 \times 12}=90 \mathrm{~N} / \mathrm{mm}^{2} .
$$

Longitudinal stress

$$
f_{l}=\frac{p d}{4 t}=\frac{2160}{48}=45 \mathrm{~N} / \mathrm{mm}^{2} .
$$

Circumferential strain

$$
e_{c}=\frac{f_{c}}{E}-\frac{1}{m} \frac{f_{l}}{E}=3.642 \times 10^{-4} .
$$

Longitudinal strain

$$
e_{l}=\frac{f_{l}}{E}-\frac{1}{m} \frac{f_{c}}{E}=8.57 \times 10^{-5}
$$

also,

$$
e_{c}=\frac{\delta d}{d}
$$

$\therefore \quad \delta d=e_{c} \times d$

$$
\delta d=0.437 \mathrm{~mm}
$$

Now,

$$
e_{l}=\frac{\delta L}{L}
$$

$$
\begin{array}{ll}
\therefore \quad & \delta L=e_{L} \times L \\
& \delta L=0.2571 \mathrm{~mm}
\end{array}
$$

Volumetric strain $e_{v}=2 e_{c}+e_{L}$

$$
e_{v}=2\left(3.642 \times 10^{-4}\right)+8.57 \times 10^{-5}
$$

$$
e_{v}=8.141 \times 10^{-4}
$$

Since,

$$
\begin{aligned}
& e_{v}=\frac{\delta V}{V} \\
& \therefore \delta V=e_{v} \times V \\
& \delta V=e_{v} \times \frac{\pi}{4}(d)^{2} L \\
& \therefore \quad \delta V=2.762 \times 10^{10}
\end{aligned}
$$

b) A simply supported beam of length $\mathbf{3 m}$ and a cross section of $100 \mathrm{~mm} X$ 200 mm carrying a UDL of $4 \mathrm{kN} / \mathrm{m}$, find

1) Maximum bending stress in the beam.
2) maximum shear stress in the beam.
3) the shear stress at point 1 m to the right of the left support and 25 mm below the top surface of the beam.
Ans: 12 kN

The maximum bending moment $=\frac{w l^{2}}{8}$.
Using bending equation:

$$
\frac{\sigma_{b}}{y}=\frac{M}{I}
$$

$\mathrm{y}=100 \mathrm{~mm}$.
$\mathrm{M}=\frac{w l^{2}}{8}=\frac{4(3000)}{8}=1500 \mathrm{~N}-\mathrm{mm}$.

$$
\mathrm{I}=\frac{b d^{3}}{12}=\frac{100(200)^{3}}{120}=6666666.67 \mathrm{~mm}^{4}
$$

Substituting these values in bending to get max bending stress $\sigma_{b}$

$$
\frac{\sigma_{b}}{100}=\frac{1500}{3000}
$$

$$
\therefore \quad \sigma_{b}=50 \mathrm{~N} / \mathrm{mm}^{2}
$$

Max shear stress
Average shear stress $=\frac{\text { shear force }}{\text { shear area }}=\frac{w L}{100 \times 200}=\frac{12000}{20000}$

$$
\tau_{a v g}=0.6 \mathrm{~N} / \mathrm{mm}^{2} .
$$

$\tau_{\max }=1.5 \times \tau_{\text {avg }}$

$$
\begin{aligned}
\therefore \tau_{\max } & =1.5 \times 0.6 \\
\tau_{\max } & =0.9 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

Shear force at $\mathrm{x}=1 \mathrm{~m}=1000 \mathrm{~mm}$.
$S F_{x=1000 \mathrm{~mm}}=6000-4 \times 1000=2000 \mathrm{~N} .=\mathrm{V}$
$\overline{\mathrm{y}}=100 \mathrm{~mm}$.
Now $\tau=\frac{V \times A \times \overline{\mathrm{y}}}{I . b}=\frac{2000 \times 100 \times 200 \times 100}{6666666.67 \times 100}=5.97 \mathrm{~N} / \mathrm{mm}^{2}$.
$\tau$ at 25 mm below top surface i.e. 75 mm above N.A
$\therefore \bar{y}=100-\frac{100+75}{2}=100-87.5=12.5$
$\therefore \tau=\frac{2000 \times 175 \times 100 \times 12.5}{6666666.67 \times 100}=0.65 \mathrm{~N} / \mathrm{mm}^{2}$.

Q6)
a) A $\mathbf{4 0 0} \mathbf{~ m m}$ long bar has rectangular cross section $10 \times 30 \mathrm{~mm}$.this bar is subjected to

1) 15 kN tensile force on $10 \times 30 \mathrm{~mm}$ faces.
2) $\mathbf{8 0} \mathrm{kN}$ compressive force on $10 \times 400 \mathrm{~mm}$ faces.
3) 180 kN tensile force on $30 \times 400 \mathrm{~mm}$ faces.

Find the change in volume if $E=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$ and $1 / \mathrm{m}=0.3$.

Ans: $E=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$.
$1 / \mathrm{m}=0.3$
$\mathrm{AB}=400 \mathrm{~mm}$.
$B C=30 \mathrm{~mm}$.
$B G=10 \mathrm{~mm}$.
Stress in x-direction
$f_{x}=\frac{15 \times 10^{3}}{10 \times 30}=50 \mathrm{~N} / \mathrm{mm}^{2}$ (tensile)
Stress in y-direction
$f_{y}=\frac{80 \times 10^{3}}{10 \times 400}=20 \mathrm{~N} / \mathrm{mm}^{2}$. (compressive).

Stress in z- direction
$f_{x}=\frac{180 \times 10^{3}}{400 \times 30}=15 \mathrm{~N} / \mathrm{mm}^{2}$.(compressive).

Strain in x direction.
$e_{x}=\frac{f_{x}}{E}-\frac{1}{m} \frac{f_{y}}{E}-\frac{1}{m} \frac{f_{z}}{E}$
$\therefore e_{x}=3.025 \times 10^{-4}$.
Similarly
$e_{y}=-1.525 \times 10^{-4}$
$e_{z}=-1.2 \times 10^{-4}$
Now
Change in $\mathrm{AB}=\mathrm{L}(\mathrm{AB}) \mathrm{X} e_{x}$

$$
\begin{aligned}
& =400 \times 3.025 \times 10^{-4} \\
& =0.121 \mathrm{~mm} \text { (increase) }
\end{aligned}
$$

Change in $\mathrm{BC}=L(B C) \times e_{y}$

$$
\begin{aligned}
& =30 \times-1.52 \times 10^{-4} \\
& =-4.575 \times 10^{-3} \mathrm{~mm}
\end{aligned}
$$

Change in $\mathrm{BG}=L(B G) \times e_{z}$

$$
=10 \mathrm{X}-1.525 \times 10^{-4}
$$

$$
=1.2 \times 10^{-3} \mathrm{~mm}
$$

New lengths:
$A B=4000+0.121=400.121 \mathrm{~mm}$.
$\mathrm{BC}=30-4.575 \times 10^{-3}=29.99 \mathrm{~mm}$
$\mathrm{BG}=10-1.2 \times 10^{-3}=9.99 \mathrm{~mm}$
change in volume $=$ new volume - original volume .
$\therefore \delta V=(400.121 \times 29.99 \times 9.99)-(400 \times 30 \times 10)$.
$\delta V=-123.71 \mathrm{~mm}^{3}$ (decrease).
b) A hollow cylinder CI column is 4 m long with both end fixed. Determine the minimum diameter of the column, if it has to carry a safe load of 250 kN with a FOS of 5 . Take internal diameter as 0.8 times the external diameter $E=200 G N / \mathbf{m}^{2}$.
Ans: $L_{e}=0.5 \times 4=2 \mathrm{~m}=2000 \mathrm{~mm}$.

$$
\begin{align*}
& \mathrm{P}=250 k N .  \tag{10}\\
& \mathrm{FOS}=5 . \\
& d_{i}=0.8 \times d_{o} .
\end{align*}
$$

## Using Euler's equation:

$$
\begin{gathered}
P_{e}=\frac{\pi^{2} E I_{\min }}{L_{E}^{2}} \\
\therefore \frac{250}{5}=\frac{\pi^{2} \times 200 \times 10^{3} \times \frac{\pi}{64}\left(d_{0}^{4}-d_{i}^{4}\right)}{(2000)^{2}}
\end{gathered}
$$

$$
\therefore \frac{250}{5}=\frac{\pi^{2} \times 200 \times 10^{3} \times \frac{\pi}{64}\left(d_{0}^{4}-\left(0.8 d_{0}^{4}\right)\right)}{(2000)^{2}}
$$

By solving we get.
$d_{o}=43.24 \mathrm{~mm}$.
Also
$d_{i}=34.59 \mathrm{~mm}$.
